EDUCATION

Ohio State University

Master of Science in Computer Science; GPA (3.96/4.0)

Columbus, United States

08/2017 – 05/2019

Zhejiang University

Bachelor of Engineering; GPA (3.97/4.0); Ranking (4/144)

Hangzhou, China

09/2013 – 07/2017

TECHNICAL SKILLS

Proficient: Java, Spring Boot, MySQL, Mybatis, Git, Keras **Familiar:** Python, C, Redis, Jekyll, \TeX

Alibaba Middleware: RocketMQ, HSF(RPC), Tair(Cache), Diamond(Persistent Config Center)

WORK EXPERIENCE

Mlab: Business Intelligence Algorithm Development Platform

Alibaba

Backend Engineer Intern

05/10/2018 – 07/25/2018

- Developed a business AI algorithm agile platform by Spring Boot from scratch, responsible for offline training, assisted in sql generation and online model deployment. Our platform is accessed by Taobao seller union activity whose DAU is 10 million, shortening development cycle to 1 week.
- Adopted three design patterns, namely Builder, Abstract Factory (done by Java Enumeration) and Template Method, to work out algorithm template node diversity, mainly due to different parameter SERDER (serialization and deserialization) and frontend form exhibition.
- Implemented exclusion strategy in Gson with Java annotation for self-defined SERDER.
- Assembled parameters of all nodes belong to a certain algorithm template and generated a http post request by Apache http client to trigger training on PAI (Alibaba offline training Platform).
- Cooperated to develop the model transfer module: Mlab server swarm read offline model from PAI, persist it to MySQL, cache customized online model to Tair and push the corresponding version object, containing extra split ratio for A/B testing, to Diamond Server. Client threads asynchronously listen to the version change and poll the latest model from Tair for real time prediction.

Deep Learning Internship

Singapore University of Technology and Design

Research Assistant in NLP Lab (published related paper to DSAA)

07/03/2016 – 08/31/2016

- Ameliorated basic multi-task deep learning model with Keras to detect the sentiment polarity, reviewer identification, subjectivity/objectivity of each text simultaneously.
- Crawled 75, 000 reviews from rotten tomato with Python. Inserted CNN for each task to capture exclusive features and gated control unit to filter noise, improving accuracy by 0.47% and 1.10% respectively.

SELECTED PROJECTS

Micro Seckill System

02/2018 – 03/2018

- Responsible for backend engineering with Spring Boot: countdown before the seckill activity (purchase merchants in a short time); avoid overselling and redundant purchase on the same item.
- Used Mybatis to implement the interface at DAO Layer, namely CRUD operation.
- Integrated log4j and Spring AOP to intercept each http request at SpringMVC controller Layer.
- Combined two cache refreshing strategy on Redis, namely timeout eviction and initiative update, to ensure the eventually consistency between cache and database.
- Adopted the transaction compensation pattern with RocketMQ to ensure high concurrency and transaction consistency involving order generation and inventory subtraction.
- Tested the concurrency performance with JMeter, achieving 1000 QPS.

Infrastructure Related Project

01/2016 – 05/2016

- **Multi-thread Programming:** Applied Lamport Clock and Java Reentrantlock to simulate restaurant. Regarded eaters and cookers as threads, and tables, machines and various food as shared resources.
- **Lisp Interpreter:** Implemented internal function of Lisp by Java to value arguments, bind them to corresponding formal parameters and recursively evaluate function body.
- **Parallel Computing:** Used tiling strategy, loop unrolling over 2 dimension and shared memory in GPU for transposed matrix multiplication acceleration, achieving 26.6 GFLOPS.
